

Democratic republic of the congo energy conservation

Overview

This interactive chart shows the average energy consumption per person each year. In the energy domain, there are many different units thrown around — joules, exajoules, million tonnes of oil equivalents, barrel equivalents, British thermal units, terawatt-hours, to name a few. This can be confusing, and make comparisons difficult. So at Our World in Data we try to maintain. Total energy supply (TES) includes all the energy produced in or imported to a country, minus that which is exported or stored. Both minerals are critical for clean energy technologies, and demand for these resources are projected to increase in response to the global energy transition. Data and multi-stakeholder dialogue will be key to support the country's. This infographic summarizes results from simulations that demonstrate the ability of Congo, DR to match all-purpose energy demand with wind-water-solar (WWS) electricity and heat supply, storage, and demand response continuously every 30 seconds for three years (2050-2052).
