

# How big a solar panel should I use for a 10-watt surveillance camera

## Overview

---

Small solar panels typically have a lower power output, ranging from 10W to 50W. This makes them ideal for powering one or two low-power security cameras, typically used in residential or small-scale applications. Or if you've installed a trail camera, game camera or wildlife camera, and want to use solar panels to power your security cameras (read this post to learn how), the online shopping platforms such as Amazon, eBay, etc., will also offer you various options. To size your system, calculate your camera's power requirements (watts × hours), choose a battery that stores enough. This is the power parameter of a typical camera. We can see that this camera needs a maximum of 50W when using Hi-POE, and 10W when using heater. Most equipment manufacturers provide their DATA SHEET which lists this information – this usually shows in. So an ~80W panel should be more than enough to run the cams and keep the battery topped to do this?

How about battery sizing?

Would one of the little HF 35 aH solar batteries work?

Awesome, Busted. My 4k resolution wired cameras. When selecting a 10W solar panel, the key factors are efficiency, durability, and compatibility with your device.
