

# How to dissipate heat from solar inverters in summer

## Overview

---

Solar inverters can be cooled in one of two ways: by using a passive cooling system or through active cooling. Passive or natural cooling means that the inverter's cooling fin dissipates heat without the need for a fan. Solar inverters are the backbone of PV systems, converting direct current (DC) from solar panels into usable alternating current (AC) for homes. Solar inverters are designed to operate within a specific temperature range. It's called thermal derating, and it's the biggest silent killer of your energy harvest.
