

Micro hybrid compression energy storage device

Overview

The hybrid energy storage system combines pumped hydro storage and compressed air energy storage for small power grids. Larger batteries (400–800 kWh) effectively reduced grid purchases and redistributed surplus energy, improving system efficiency. 5–2 bar and high head conditions, offering long-duration, low-degradation storage. There are two tanks, one open to the air and one subjected to compressed air, as well as a micro-pump turbine. The growing popularity of portable electronic devices has led to a high demand for advanced energy storage technology, driven by advancements in power generation, electrification, and transportation.
