

Microgrid AC DC conversion

Overview

In an AC microgrid, power electronic converters are used to convert DC power (from PV cells, batteries, EVs, etc.) or variable frequency AC power (from wind turbines) into 50/60 Hz AC power so that the power can be fed into the AC bus and supply loads. This paper presents a control method converters for hybrid AC/DC microgrid in stand-alone mode, the converters will be controlled to operate bidirectionally, transmitting power back and forth between the two subgrids AC and DC. The control method will maintain the voltage and frequency stability of. In order to reduce the economic costs, enhance the efficiency, and improve the structural stability of microgrids, this paper proposes a novel AC/DC hybrid microgrid structure. This structure, based on Silicon Controlled Converters (SCCs) and Polarity Reversal Switches (PRSs), enables bidirectional. All of our electrical technology today can trace its roots back to AC. This method, championed by Nikola Tesla, solved the biggest problem of the time: how to send power over long distances. This work presents a multifunction converter structure that integrates a two-way power conversion method in grid-connected or independent DC/DC/AC/DC for microgrids. In this converter system.
