

# Nigerian power grid demand-side response energy storage

## Overview

---

Battery Energy Storage Systems offer a robust mechanism to stabilize Nigeria's fragile grid by addressing frequency fluctuations and managing peak load demands effectively. These systems store energy when production exceeds consumption and dispatch it when needed, ensuring a balanced. Balancing electricity demand and supply remains a significant challenge for the power systems in developing countries, such as Nigeria. In Nigeria, there is a shortage of adequate power supply, and demand-side management (DSM) plays a minor role in the power balancing mechanism with load shedding. Energy storage systems (BESS) offer a solution to this distressing incessant grid stability and collapse. A Central Composite Design (CCD) was used to generate a design matrix for data collection, with EnergyPLAN software used to create energy system. The persistent growth of unserved load and rising customer dissatisfaction in the Nigerian Electricity Supply Industry (NESI) underscore the urgent need for improved energy management strategies. Enhances energy security and resilience, 2.
