

Photovoltaic panels as water tanks

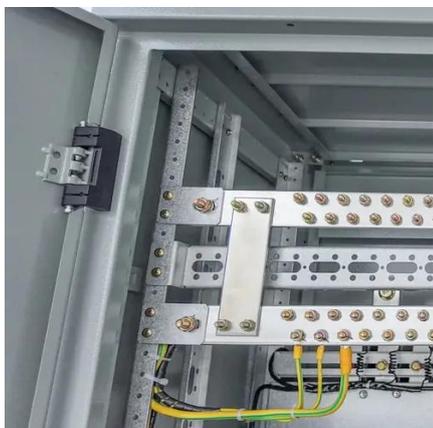

Overview

Researchers at the Dublin City University in Ireland have proposed a new design for photovoltaic-thermal (PVT) modules based on a water tank that simultaneously provides PV panel cooling and generates hot water for domestic use. Solar water heaters—sometimes called solar domestic hot water systems—can be a cost-effective way to generate hot water for your home. They can be used in any climate, and the fuel they use—sunshine—is free. The article details the installation process, benefits, and financial incentives associated with these systems. However, if you use excess solar power to produce hot water, less electricity goes into the grid and you can increase your self-consumption to around 70%. By tapping into the sun's endless power, solar water heating offers an efficient and eco-friendly way to keep your home or business running smoothly. The primary components of a typical solar-powered tank.
