

# Solar steam power generation and heating

## Overview

---

Solar power steam generators convert solar energy into steam by using solar collectors. These devices gather sunlight, which heats a fluid. The structure — a layer of graphite flakes and an underlying carbon foam — is a porous, insulating material structure that floats on water. When sunlight hits the structure's surface, it creates a hotspot in the. These systems harness sunlight to produce steam, which can drive turbines to generate electricity or be used in various heating applications. The decarbonization of industrial thermal demand relies on the capability of clean and renewable technologies to provide steam through reliable and cost-effective systems. It effectively harnesses solar power, 2.
