

Solar support modeling

Overview

Welcome to our comprehensive guide on the best solar modeling software for 2025. This project was a three-year effort leveraging the Department of Energy's (DOE's) past investment in National Renewable Energy Laboratory (NREL) system modeling capabilities and platforms to continue to provide valuable and extensible photovoltaic (PV), battery, and financial modeling resources. With Dlubal Software, you can model, analyze, and design any type of photovoltaic support structures and mounting systems efficiently. From load determination to verification of steel, aluminum, and concrete parts, all steps are integrated into one consistent environment for code-compliant design. There are several types of photovoltaic mounting structures: The first three will be covered in this and following articles in the series. Department of Energy (DOE) supports research and development (R&D) to extend the useful PV system life to 50 years. However, they exhibit low stiffness, light weight, and low damping, making them wind-sensitive and prone to wind-induced. Flexible photovoltaic (PV) support systems have low stiffness, low damping, and may suffer from aerodynamic instability, especially fluttering, under wind loads.
