Overview

To an engineer, a neutral conductor is a current-carrying wire that balances the unbalanced current in three-phase systems and is connected to the ground. In North America, it's color-coded white or gray for easy identification. The series connected inverters are employed for compensating the asymmetries of the non-linear loads or the grid by injecting the negative sequence voltage. I've daisy chained (or looped) the neutral input to the neutral output behind the inverter. But to a developer, EPC or. Does your inverter have a common neutral and does your transfer switch switch the neutral?

The answer to the latter is probably no, so it comes down to whether or not neutral input on your inverter is the same as neutral output. Get this wrong, and you're basically.
