

Transformer inside the photovoltaic inverter

Overview

The solar transformer is the electrical “heart” that changes the output of a low-voltage inverter into medium-voltage levels for collection or export. It does this while making sure that everything is safe, works with other devices, and is reliable. Photovoltaic panels convert sunlight into direct current (DC) electricity, which then flows to inverters that transform this DC power into alternating current (AC) electricity compatible with grid standards. They handle the wide swings in power supplied from the solar array. The inverters do all this. Transformers that don't match, run hot, or change the quality of the power make PV plants work less well. If not fixed, losses, trips, and fines will happen. Its main function is to step up or step down the voltage output from solar inverters, enabling efficient energy transmission to the. In this paper, the author describes the key parameters to be considered for the selection of inverter transformers, along with various recommendations based on lessons learnt.
