Overview

DOE funds solar research and development (R&D) in parabolic trough systems as one of four concentrating solar power (CSP) technologies aiming to meet the goals of the SunShot Initiative. Unlike photovoltaic systems that stop at sunset, trough thermal plants keep generating power. Solar energy represents a huge domestic energy resource for the United States, particularly in the Southwest where the deserts have some of the best solar resource levels in the world. Parabolic trough is the linear-focus collector, which consists of a first known parabolic trough collector. He used it to power a hot air engine.
