

Vanadium pentoxide in flow batteries

Overview

Vanadium pentoxide can be an inexpensive replacement to vanadium sulfate in synthesizing vanadium redox flow battery (VRFB) electrolytes. In this study, VRFB electrolyte is synthesized from vanadium pentoxide using an indigenously developed process and setup. [5] The battery uses vanadium's ability to exist in a solution in four different oxidation. The battery uses vanadium ions, derived from vanadium pentoxide (V_2O_5), in four different oxidation states. These vanadium ions are dissolved in separate tanks and pumped through a central chamber where they exchange electrons, generating electricity. This review analyzes mainstream methods: The direct dissolution method offers a simple process but suffers from low dissolution rates, precipitation.
