## Overview

---

Lithium iron phosphate (LiFePO<sub>4</sub>) batteries have become a cornerstone of energy storage solutions due to their long lifespan, thermal stability, and eco-friendly profile. Unlike traditional lead-acid batteries, they provide 30% higher energy density and can endure 5,000+ charge. Why are lithium-ion batteries, and not some other kind of battery, used in electric cars and grid-scale energy storage?

Lithium-ion batteries hold a lot of energy for their weight, can be recharged many times, have the power to run heavy machinery, and lose little charge when they're just sitting. Additionally, lithium iron phosphate batteries can be stored for longer periods of time without degrading. The longer life cycle helps in solar power setups in particular, where installation is costly and replacing batteries disrupts the entire electrical system of the building.
